

How to test your Managed Application package before publishing

docs.wetransact.io/how-to-test-your-managed-application-package-before-publishing

Before submitting your .zip package (containing mainTemplate.json and createUiDefinition.json) through the WeTransact portal, we recommend running these two checks. They catch the vast majority of certification failures early – saving you a rejection cycle with Microsoft.

● Step 1 – Preview your deployment UI

Takes about 2 minutes, no installation needed.

1. Open the createUiDefinition sandbox in the Azure portal:

https://portal.azure.com/#view/Microsoft_Azure_CreateUIDef/SandboxBlade

1. Paste the full contents of your createUiDefinition.json into the editor.

1. Click **Preview**.

You'll see the exact purchase wizard your customers will see. Check that:

- All fields render correctly
- Validations behave as expected
- No steps are broken or empty

● Step 2 – Validate your ARM template with ARM-TTK

This is the same test toolkit Microsoft uses during certification, so passing it locally means far fewer surprises at review.

1. Download the ARM Test Toolkit: <https://learn.microsoft.com/azure/azure-resource-manager/templates/test-toolkit>

1. Unzip your package into a folder, then run the following in PowerShell:

```
Import-Module .\arm-ttk.psd1 Test-AzTemplate -TemplatePath .\your-package-folder
```

1. The output lists every failed rule with the exact file and property to correct. Fix, re-run, and repeat until all tests pass.

Next step – submit through WeTransact

Once both checks pass, upload your .zip package to your listing in the WeTransact portal and submit.
